Introduction

Wordfast Anywhere (WFA) is the online version of the popular CAT tool Wordfast Classic. Instead of being installed under MS-Word, WFA is made accessible from our servers via a web browser, regardless of the operating system used (Windows, Mac, Linux, etc.). Every effort has been made to ensure that the user interface is as close as possible to Wordfast Classic: toolbars, icons, shortcuts, methods. A Wordfast Classic user should be able to use WFA with almost zero assimilation time.

With WFA you can translate a wide range of both editable (TXT, DOC, DOCX, RTF, XLS, PPT, TXML, MIF, INX, etc.) and non-editable (PDF) documents. You can keep up ten documents in your workspace, deleting your finished translations to free up your space and permit new documents to be uploaded. You can also import the TMs (translation memories) of all the language pairs you use. Your memories will progressively expand as and when you translate. They are secure and will not be shared or revealed without your authorisation. You can also download your TM if you need a local copy.

As is the case with Wordfast Classic, you can add terms to your glossary as you translate. You can also upload all your glossaries to your workspace, for all your language pairs. Here again, your glossaries are secure and will not be shared or revealed unless you specifically invite a colleague. You can also download your glossary if you need a local copy.

The following instructions have been written for complete beginners. Having understood the above comments, a Wordfast Classic user should have no difficulty in using WFA intuitively.

---

1 The Verbs upload (upload to a server) and download (download from a server) are invariably translated by télécharger in French. To mark the difference, we will use here télécharger for download and the Québécois variant téléverser for upload.
## Logging in to a WFA account

To use WFA you first have to log in to an account. The Wordfast Anywhere site is accessible via your browser from the following URLs: [http://anywhere.wordfast.net](http://anywhere.wordfast.net) or [http://www.freetm.com](http://www.freetm.com). To benefit from a completely secure SSL (https) connection, use the URL [https://www.freetm.com](https://www.freetm.com). The WFA site will appear with the following screen in front:

![Login Screen](image)

**Fig. 1 - Login**

If you have already setup your free account, simply enter the **Login** (email address) and **Password** (your password) information and click on Connect. If you ever forget your password, click on the **Forgot your password?** link to receive it by e-mail. You also have the opportunity to read the terms and conditions by clicking the **Conditions and Terms** link.

If you do not already have an account: click on the **Register a new account** link. You will see the following:

![Register a New Account](image)

**Fig. 2 – Login (first time)**

Enter your email address in the **Email** field (this address must be valid since it is by means of this that you will receive our communications, including your password if you forget it). Now enter the password of your choice, which must have at least 5 characters and include a numeral, in the **Password** field. Repeat the password in the **Confirm password** field. Finally, click **Create** to create your account or **Cancel** to cancel your registration.

Next you will set up your account. This configuration is minimal, allowing you to start translating immediately. You can refine your configuration later.
You must specify the languages (source and target) of your translation. Since English is the most used language in the world, its code (EN) is already provided. Enter a dash to the right of EN in the **Source code language** field to obtain a list of English versions available:

If the source language of your document for translation is not English, enter its code. The first letter will display the available languages and variants, for example:
Choose your language and variant. Then repeat for the target language. Finally, click **OK**.

Note: machine translation (MT) is activated and will be used if your translation memory has no translation to offer. To disable the MT, or for more details on how it works, please see **Machine translation**.

Warning: Your connection will be suspended after a certain period of inactivity. If this happens, simply re-enter your password.
The workspace

Once you are connected to WFA, the workspace appears, which has by default a similar appearance to the following screenshot:

![The workspace](image)

This aspect can be modified at a later point in time according to your requirements.

Preparation of the translation environment

Before beginning the translation of a document using a CAT tool, you must first have an active translation memory (note: an initial translation memory was automatically set up when you created your account; if this is your situation, please go to the next step, Selecting an existing TM). This memory consists of a database into which everything that you translate will be recorded. This allows you to obtain translations of phrases made previously that are the same or similar to the one you are currently translating. It is widely referred to as a TM (Translation Memory).

Creating a translation memory

To create a translation memory, click on the File menu:
And then on TMs and Glossaries:

Click on the Setup link:
Click on the New TM button:

The TM is specific to each language pair you translate. For the purposes of all our discussions below we will use the English-French language pair. You must specify the language of the source document. In the Source Language field, enter EN. WFA will then propose several different English variants. In our example we will use the American variant, or EN-US. Now we will do the same thing for the target language, type FR in the Target Language field. From the several variants proposed by WFA select FR-FR.

It is recommended that you have only one TM for each language pair. This way, you will benefit from everything you have already translated in each pair. However, there may be reasons for you to maintain different TMs in the same language pair. In this case, enter an ID using up to 10 characters in the Symbolic Name field. Then click OK. Returning to the previous window, click on the Save settings button. Your TM has now been created.
Choosing an existing TM

If you have already created a TM you can now start your translation. The last TM that you used remains at your disposal until you change it. However, if you have multiple TMs, whether because you are translating more than one language pair or because you decided to create more than one TM per language pair, it will be necessary to select the TM to use for your translation, if different from the one used last time. To do this, click the File menu,

![Fig. 8 – File Menu](image)

then on TM and Glossaries:

![Fig. 9 – Configuring the TM](image)

Click on the Setup link:
In this example, the choice is between an EN-FR or FR-EN TM. Choose the one you need and click on OK. Returning to the previous window, click on the Save settings button.

**Uploading of a Wordfast Classic or Pro TM**

If you already have a TM that you use with Wordfast Classic or Pro, you can upload it to WFA. You can either upload it directly or add it to your existing TM.

To directly upload a Wordfast Classic or Pro TM onto WFA, you must click on the Upload button.

The codes for source and target languages are written in the header of the TM. If you already have a TM in the same pair, ensure that you enter an identifier of up to 10 characters in the
Symbolic Name field. Finally, click on the OK button. Returning to the previous window, click on the Save settings button.

To add a TM from Wordfast Classic or Pro to an existing WFA TM, click on the Merge button. The memory to import will already have predefined source and target languages codes in the header of the TM. There may therefore be a conflict of languages between it and the existing memory. If the languages are different, the import will be rejected. By default the import will not take language variants into account. If you want to make sure exactly the same variants are merged, tick the Check variant option.

You also have the option, in case there are identical source segments, to retain the existing segments (Keep Existing TUs), or to overwrite them (Overwrite existing TUs). Finally, click on the OK button. Returning to the previous window, click on the Save settings button.

This procedure is exactly the same if you have a TM from another CAT tool. However, check that this TM has been exported in the TMX format, the standard format adopted by all CAT tool developers.

Depending on its size, uploading a TM may take some time. In this case it can be run in the background, allowing you to perform other tasks.
Starting translation

Uploading a document to be translated
To translate your document, you must first upload it to WFA. To do this, click on the File menu:
Click on the Upload Document File menu option.

Fig. 12 – Upload Menu

The following window will be displayed:
Click on the **Browse** button to navigate through the directories on your computer and locate the document to be uploaded. The list of available formats can be displayed by clicking on the **View allowed file formats** link. Once your document has been located and is displayed in the **Browse a local file** field, click the **Submit** button. The document will be uploaded to WFA. Warning: depending on the size of the file, this may take some time. Please be patient.

You can also upload a file that is located on an Internet server. This feature is useful for tablet computers and other mobile devices that do not possess a hard drive. In this case, enter the address (URL) into the **Provide a file URL** field.

Once uploaded to WFA, the document is displayed in the document area.
Before starting to translate, it is important to understand the concept of segmentation.

**Segmentation**

In order to be translated with a CAT tool, a document is divided into *translation units (TUs)*, also known as *segments*. This process is called segmentation. A segment is a text string that ends with a terminator segment, usually the period (.), colon (:), question mark (?), or exclamation mark (!) and also a paragraph or end of cell mark, a page break or a tab. This can be modified, as you will see later. The advantage of segmentation is that the translation units are presented to you one by one, without any danger of missing one. These are the TUs that are saved in the TM, consisting of the source segment (to translate) and the target segment (translated).

When you open a document on WFA, the first segment is coloured light blue, as in the picture above.

**Translating**

To start the translation, you must first open the initial segment. To do this, click the first icon on the left side of the toolbar or use the *Alt + Down* shortcut. When you do this, the document area is transformed: a new toolbar is shown, the first segment is displayed in light blue block, a grey block is placed just below and the rest of your document is shown on the rest of the page. The cursor is located in the grey block.

Translate the segment in the grey block
After translating this segment, you can move on. Click on the icon on the segment toolbar\(^2\), or use the \textbf{Alt+Down} shortcut. Remember this shortcut, you will use it for each segment you translate.

Warning: WFA does not have its own spell check. However most browsers, notably Firefox and Chrome, have their own spell check – all you need to do is activate it.

When a segment to be translated has no counterpart in the TM, the lower block has a grey background. If WFA finds a segment in the TM that exactly matches the segment to be translated, it places the translated segment in the lower block against a green background. If WFA finds a segment in the TM that corresponds approximately to the segment to be translated, that is to say with a similarity of 75% or more, it displays the translation in the lower block against a yellow background.

Note that above the upper block, between the two blocks and after the lower block, there are purple tags. The tag between the two blocs has the format \textless }0\textgreater . This zero means that WFA has not found any segment corresponding to at least 75% of the segment to be translated in the TM. When the lower block has a green background, the tag has the format \textless }100\textgreater , which means that the match is 100%. When the lower block has a yellow background, the number in the tag can be anywhere between 75 and 99, which is the percentage of correspondence between the TM and the segment to be translated.

\(^2\) Since there are two toolbars, we will speak more often of the new one, which was added to the document area. The top bar is the same as that used in Wordfast Classic, allowing users to translate without becoming disoriented. However, the new bar is more specific to editing a segment, which is why it is referred to as the "segment toolbar."
Before translating this new segment, pay attention to the tag <1>, which appears at the beginning. WFA is not a word processor and cannot concern itself with the document's formatting. You'll see no changes in size or typeface, no bold or italic characters. This information is encoded and represented by <1>, what we call "tags". By slowly passing your mouse over this tag you will see what it represents. This tag is not to be translated, but it should be copied. To copy it, the quickest way is to select it by clicking on it or by using the and icons (shortcut Ctrl+Alt+Right and Ctrl+Alt+Left). A red frame indicates the selected item. Then position the cursor in the target segment and click on the icon (Ctrl+Alt+Down). The tag is copied to the grey block. Now translate the segment as before.

Now that you get the idea, you can continue to translate. Remember: to move from one segment to the next, use Alt+Down. To return to the previous segment (to correct something that you subsequently realised was mistaken), use Alt+Up.

**Main commands**

**Provisional segment.**

You may be unsure whether your translation of a segment is correct. To avoid having to interrupt your translation process, you can mark the segment as provisional. It will be identified by a yellow square at the beginning of the line. To mark a segment as provisional, use the F10 key or button.

When you have resolved any doubts, simply return to the marked segment and make your corrections. Use Alt+Down (↓) or Alt-Up (↑) to validate the segment and erase the yellow square.

**Note.**

You can also write a note to be attached to the segment for the duration of the translation (in a similar manner to a Post-It™). You can use this to remind yourself of something important about this segment or to pass information on to people who will have access to your translation, such as reviewers. To write a note, click the icon. The following text box will be displayed:
Write your note in the text box and click **Save**. You can cancel the operation by clicking **Cancel**. In the case of an existing note, you can edit and validate it by clicking **Save**, or delete it by clicking **Remove**.

A green square will be placed at the beginning of the segment to indicate that a note is attached. By passing the mouse pointer over this square, you will see a rectangle containing the text of the note.

Please be aware that this note cannot be saved as a MS-Word note.

**Copying the original segment.**

Sometimes a segment contains very little to translate: for example, when it consists almost entirely of proper names. In this case, it is perhaps preferable to copy the source to the target segment and make any adjustments there. To do this, click on the icon or use the shortcut **Alt-Ins**.

**Erasing the target segment**

It is sometimes necessary to erase what you have just written in the target segment. The easiest way to delete the target segment is to click the icon or use the shortcut **Ctrl+Alt+X**. Clicking on this icon a second time can retrieve the deleted segment.

**Insertion of a non-breaking space**

When you write in French, some characters must be accompanied by a non-breaking space: before the colon, semicolon, exclamation mark, question mark, exclamation mark, before and after quotes, thousands separator, and so on. However, such spaces cannot be automatically handled in an Internet browser as they are when using a text editor such as Word. It is therefore necessary to add them manually. A non-breaking space is inserted at the cursor location by clicking on the icon.

**Expanding a segment**

As we have seen, WFA considers that the segment is terminated when it encounters a segment termination mark. In some cases this segmentation is erroneous. For example, when WFA meets the following sentence:
This process was discovered by Prof. Johnson-Koszwoldszky one year ago. It considers that the segment ends with Prof. because it interprets the full stop as an end of segment marker. In this case we can instruct WFA to expand the segment, that is to say, to join it to the following one.

![Fig. 20 – Segmentation error](image)

This is done with the **Alt+Pg dn** shortcut or the ![icon](image) on the Wordfast toolbar.

![Fig. 21 – Segmentation error corrected](image)

It is important to expand segments when the segmentation has not been properly performed in order to increase the chances of it corresponding with a translation memory segment. For example, the segment *Johnson-Koszwoldszky one year ago* will have little chance of having a similarity of over 75% with another. By contrast, if the sentence *This process was discovered by Prof. Johnson-Koszwoldszky one year ago* is in the TM when WFA encounters the source sentence *This process was discovered by Professor Johnson-Koszwoldszky one year ago*, it will offer its translation, as it has 90% similarity (it is only the word *Professor* that is not the same).

A segment cannot be expanded if it is terminated by an end of paragraph or end of cell marker, a page break or a tab.

You should not have to expand all segments containing abbreviations that end with a full stop. A list of common language-specific abbreviations is included in WFA and can be modified (see the segmentation tab in the configuration dialog box).

**Shrinking a segment**

If, on the other hand, two segments are displayed together due to an absence of an end of segment marker, shrink the segment with the shortcut **Alt-Pg up** or the ![icon](image) in the Wordfast toolbar. This may occur if the author of the source text has forgotten to insert a full stop separating two sentences.

**Ending the translation.**

If for any reason you want to stop translating, you have a choice: to close the translation and validate the current segment in the TM (**or **Alt+End), to close it without validating it (** or **Shift+Alt+End), or to clear the content of the target segment together with any attached note by clicking on the ![icon](image) icon.
Revision of the translation

Once translated, the text should be revised. WFA’s bilingual document display format may not be optimal for reading purposes. To toggle the display between the bilingual document, the original document and the translated document, use the shortcut Ctrl+, (Ctrl+comma). With each iteration, a different display mode is presented. To be sure of what you see in front of you, check the indication on the status bar: bilingual document (Bilingual), the original document (Source) and the translated document (Target):

![Status Bar Indications]

Attention: this shortcut does not alter the document in any way. It serves only to provide a more user-friendly display.

You can also view your translated document in its finished form in PDF format. To do this, click on the Preview button.

Delivery of the translation

When the translation is finally complete, you must download the final document in order to be able to deliver it. To do this, click File, then Download Document File.

![Download Document File Menu Option]

Fig. 22 - The Download Document File menu option

If it so happens that you have not yet fully translated the document, you will receive this message:
This is merely an advisory warning in case you have forgotten to translate a segment or if there are provisional segments or notes. However it is quite possible that this is your intention: sometimes some segments should not be translated. At any time you can find out if you have completed the translation, or how many segments remain to be translated, by clicking on the icon (outline) in the upper left corner of the workspace. When the outline has been activated, its icon will be displayed pointing in the opposite direction.

Each square represents a segment:
- A grey square indicates that the segment has not yet been translated
- A green square indicates that the segment has been translated
- A yellow square indicates a provisional segment
- An I in a square indicates that this segment has a note attached
- The pink background shows the segments visible in the document area

More information about the outline can be found in the Outline section.

In this example, segments 1 to 5 have already been translated, the 2nd has a note and the 4th is provisional.
If you wish to return to your document to verify this, click **Cancel**, otherwise click **OK**.

The following message will be displayed:

![File download dialog box](image)

You can cancel the download by clicking **Cancel** or continue by clicking **OK**. At this point you have the choice to add a second document in PDF format to the downloading of the document in its original format. To add the PDF-formatted document, tick the **Add PDF file** box. This may take some time, so please wait. You can verify that this operation is taking place: a series of small blue rectangles will display the progress in the status bar:

![Progress bar](image)

If the size of your document is less than 1 megabyte, you will receive the document in its original format, otherwise it will be compressed to ZIP format (*.zip). Warning, this can cause a problem for users of certain versions of Mac OS.

If you have requested the PDF file, both files, the original and the PDF, will always be compressed in ZIP format (*.zip).

After you click on the **OK** button, Wordfast Anywhere prepares the data transfer and then sends it to your browser, which then informs you that it has received the data according to its mode of operation. In the optimal case, a dialog box will pop up allowing you specify where to save the file; however, this depends on the browser employed.

If nothing happens, check the downloads configuration in your browser and / or repeat the process.
**Placeables**

A placeable is any term or expression contained in the source segment that is capable of being recognised by Wordfast. Placeables often consist of elements that are found as such in the translation. WFA provides shortcuts for inserting them into the translation, which both saves time and reduces typing errors.

WFA considers as placeables:
- Numbers
- Tags
- Capitalised words
- Words beginning with, or otherwise containing, capital letters

We have already seen how to copy tags. Given that a tag is a placeable, the procedure is the same: to copy a placeable, simply select it with the or icons (shortcut Ctrl+Alt+Right and Ctrl+Alt+Left). You also have the possibility to click on any term to thus contextualise it and turn it into a placeable. A red frame indicates the selected item. Then position the cursor in the target segment in the position where the placeable should be positioned and click on the icon (Ctrl+Alt+Down). The placeable is copied to the target segment.

In this sentence, the placeable elements, selected by Ctrl+Alt+Right or , are:

- The first unit was produced in 1989 by ABC Engineering (Sweden) (starts with a capital letter)
- The first unit was produced in 1989 by ABC Engineering (Sweden) (number)
- The first unit was produced in 1989 by ABC Engineering (Sweden) (all uppercase)
- The first unit was produced in 1989 by ABC Engineering (Sweden) (starts with a capital letter)
- The first unit was produced in 1989 by ABC Engineering (Sweden) (starts with a capital letter)
- The first unit was produced in 1989 by ABC Engineering (Sweden) (tag)

And, if necessary, any term may be designated as a placeable simply by clicking on it:
As you translate the text, you only want to place those elements that should not be translated:

The first unit was produced in 1989 by ABC Engineering (Sweden).<ref>
La première unité a été produite en 1989 par ABC Engineering (Suède).<ref>

At this point, you want to write 1989. However it may be faster and more efficient (no possibility of error) to select the item using Ctrl+Alt+Right or (or even by simply clicking on it) and place it into the segment target with Ctrl+Alt+Down or . Continue, and type "par":

The first unit was produced in 1989 by ABC Engineering (Sweden).<ref>
La première unité a été produite en 1989 par ABC Engineering (Suède).<ref>

The following two words should both be placed, so we repeat the procedure with "ABC" and "Engineering." However, "Sweden" must be translated, so we type "Suède" and then place the tag:

The first unit was produced in 1989 by ABC Engineering (Sweden).<ref>
La première unité a été produite en 1989 par ABC Engineering (Suède).<ref>

You can also use the shortcut Ctrl+Alt+Up or the icon to transform all the terms contained in the source segment into placeables.

For even greater efficiency, when you type a letter and then successively press Tab, all words beginning with that letter are written. For example, in the above sentence: A+Tab will produce ABC (the only capital letter in the sentence) and E+Tab will produce Engineering. This method is much faster than copying placeables.
**Terminology**
The use of incorrect terminology can ruin a good translation; the converse is also true. Many clients have a well-defined terminology (the jargon of the trade), compiled in the form of a glossary. The client thus can *impose* a particular terminology. In this case, very common in technical translation, the end result should harmoniously fuse the linguistic competence of the translator with the terminological requirements of the client.

Sometimes the client asks the translator to provide him or her with a glossary of terms arising from research undertaken during the translation. In this case, the translator must create a glossary and add specific terminology to it. This glossary building can either be done prior to translation (in an initial terminology research phase), or during the translation itself.

In many cases, however, the client provides a bilingual glossary, which has already been created during the course of previous translations. It is then up to the translator to comply strictly with it and, where appropriate, to add his or her own contributions.

Wordfast Anywhere is designed to assist the translator in all the cases mentioned above through the implementation of its glossary function. This glossary is a simple text document, in which the columns are delimited by tabs.

**Creating a glossary**
Click on the **File menu**, then on **TM and Glossaries**:

![Fig. 24 – File Menu](image)
Click on the **Setup** link, then click the **Glossaries tab**:

![Setup Tab](image)

**Fig. 25 – WFA Setup**

Click on the **New button**:

![New Button](image)

**Fig. 26 – Configuration of the glossary**
The glossary follows the same rules as the TM; that is to say, it must be prepared for the same pair of languages. For the purposes of all our discussions below we will use the English-French language pair. You must specify the language of the source document. In the Source Language field, enter EN. WFA will then propose several different English variants. In this example, we will use the American variant, or EN-US. Now we will do the same thing for the target language, type FR in the Target Language field. From the several variants proposed by WFA select FR-FR.

In general, translators use only one glossary per language pair. In this way, all the terms relevant to a pair of languages are concentrated in a single glossary. However, you may have reasons for maintaining different glossaries in the same language pair (by subject area, client, etc.). In this case, enter an ID of up to 10 characters in the Symbolic Name field. Then click OK. Returning to the previous window, click on the Save settings button. Your glossary has now been created.

**Selecting an existing glossary**

Once you have created a glossary, it is always available. However, if you have multiple glossaries, whether because you are translating more than one language pair or because you decided to create more than one glossary per language pair, it will be necessary to select the glossary to use for your translation, if different from the one you used last time. To do this, click on the File menu:
then on **TM and Glossaries**:

![Fig. 29 – WFA Setup](image)

Click on the **Setup** link, then click the **Glossaries tab**:

![Fig. 30 – Configuration of the glossary](image)
Here you can choose between an EN-FR and an FR-EN glossary. Choose the one you need by clicking on it (it will be displayed against a blue background) and click OK. Returning to the previous window, click on the Save settings button.

**Uploading of a Wordfast Classic or Pro glossary**

If you already have a glossary that you use with Wordfast Classic or Pro, you can upload it to WFA. You can either upload it directly or add it to your existing glossary. To directly upload a Wordfast Classic or Pro glossary to WFA, you must click on the Upload button.

![Fig. 31 – Uploading a glossary](image)

Unlike the TM, WFA does not know the source and target languages of the glossary; therefore you must specify them. However, if you already have a glossary in the same pair, ensure that you enter an identifier of up to 10 characters in the Symbolic Name field. Finally, click on the OK button. Returning to the previous window, click on the Save settings button.

To append a Wordfast Classic or Pro glossary to an existing WFA glossary, you must first select the existing glossary by clicking on it and then clicking on Merge. Attention, the glossary to be imported must have the same source and target language codes as those defined in the existing glossary. It is recommended to compress the glossary to a .ZIP archive before uploading it.
You will be asked to select the glossary to be uploaded (click the **Browse** button):

When you have located it, click on **Submit**. Once the glossary has been uploaded, you will receive a report summarising the operation:

You will see how many words have been uploaded, how many were rejected as well as how many already existed in the glossary (in the case of an append). Close this dialog by clicking **Close**. Finally, click on the **OK** button. Returning to the previous window, click on the **Save settings** button.

**Using a glossary**
Whenever WFA recognises a term from the glossary in the source segment it highlights it against a blue background:
The terms highlighted in blue are considered as placeables. They can thus be manipulated with the and icons or the Ctrl+Alt+Right and Ctrl+Alt+Left shortcuts and by clicking on them with the mouse or by typing their initial letter + Tab. The difference is that when you use the icon or the Ctrl+Alt+Down shortcut it is the corresponding translation that will be copied to the target segment.

You can know in advance what the translation of the highlighted items is by activating the glossary panel ( icon of the Wordfast toolbar)

![Glossary Panel](image)

If you want to know more about a term, i.e. the comments or the contents of the F1, F2 and F3 fields, move your mouse over the source term and this information will be displayed:

![Glossary Details](image)

**Adding terms to the glossary**

It is quite likely that you will want to incorporate certain terms and their translations into the glossary. WFA allows you to do this dynamically, at any time and without stopping your translation. Simply select the source term (one or more words) and type Ctrl+Alt+T (or Tools menu, Glossary Dialog Box or the icon)
The original term is already in the **Source** field. Simply add the translation in the **Target** field. You can also add a comment – something that may prove useful in the future, if you want to remember the situation in which this translation was used. Then click **OK** to confirm or **Cancel** to dismiss the dialog.

**Fuzzy terminology recognition**

Each time the translator opens a segment, Wordfast Anywhere verifies the presence in the glossary of the terms contained in the source segment. This operation is called terminology recognition. The recognised terms are highlighted in blue in the source segment, as indicated above.

It is therefore a question of establishing a correspondence between the terms of the source segment and the terms found in the glossary. WFA will both recognise an exact match and attempt to recognise fuzzy matches. Fuzzy matching is established with the help an asterisk at the end of term. This method gives good results for technical jargon, which is generally made of expressions rather than isolated words, and long words instead of short words. Terms such as *double furnace boiler or power plant* will always be recognised even if they appear in the plural.

If the terms in the glossary have added an asterisk as in the example shown above, that is to say *power plant*, Wordfast will be able to recognise *power plant* as well as *power plants.*
Bilingual file tools

Downloading TXML file

You can download your document in TXML format, the standard working file format used by WFA, which is the same as that used by Wordfast Pro. This permits you, for example, to send the file to a colleague for review using Wordfast Anywhere or Pro. Once reviewed and corrected, you can upload it again.

To download your working file, click File, then Bilingual File Tools and then Download Txml File:

![Fig. 36 – Downloading Txml file](image)

If your translation is incomplete or contains provisional segments or notes, you will receive this warning:

![Confirmation](image)

At this point you have the choice to accept (OK) or cancel (Cancel) to return to your translation. If you accept, you will need to consider the following message:
You can optionally instruct WFA to copy the source segment to the target segment if it is blank (check **Copy source to target if target is empty**) and/or to ignore language variations, for example not to make a distinction between British and American English (check **No language variants**). You also have the choice, by clicking the **Advanced** option, to use an alternative filter in the case of an error occurring on the last download (check **Use alternative filter**).

**Merging TXML files**

If you have a file in TXML format you can upload it to your workspace. To do this, click **File**, then **Bilingual File Tools** and then **Merge Txml File**:

![Fig. 37 – Merging a TXML file](image)

At this point you must complete the following dialog box:
By checking **Merge an existing document**, all documents that exist in your workspace will be listed according to language pair, and you will have to choose which will be merged with the file you intend to upload.

You can also set WFA to update the TM corresponding to the file you upload (check **Update or create a TM with a bilingual document**). Check **Merge an existing TM** and choose which TM to update from the list displayed. You will also need to determine whether, in the case of identical source segments, new TUs should be added to existing ones (**Keep existing TUs**) or whether they should replace them (**Overwrite existing TUs**). If, on the other hand, you prefer to create a new TM, click on **Create a new TM**. At this point, you will have the opportunity to give this new TM a name, if you have more than TM for the same language pair. Then click **Upload** to upload the file or **Close** to exit without doing anything.

Note that operations performed on the document are independent from memory-related operations, allowing you to update only the document, or only the memory, or both.

If you have clicked **Upload**, you will receive the following message:
Click **Browse** to navigate through your directories and select your file and then click **Submit** to perform the upload or **Cancel** to cancel the operation. If you perform the upload, please wait until the appearance of the operation report.

**Other downloads**
You can also download the working file as an MS-Word (*.doc) file containing bilingual segments, usable by Wordfast Classic (and Trados Workbench).

![Fig. 39 – Downloaded WFA document in Wordfast Classic](image)

This will allow your document to be proofread by a Wordfast Classic user. Caution, this download is only available for files formatted as .doc and .rtf. Unlike the TXML file, this format cannot be imported into WFA.

To download your working file in bilingual MS-Word format, click **File**, then **Bilingual File Tools** and then **Download Bilingual Word File**:
If your translation is incomplete or contains provisional segments or notes, you will receive this warning:

At this point you have the choice to accept (OK) or cancel (Cancel) to return to your translation. If you accept, you will need to respond to the following message:

You also have the choice, by clicking the Advanced option, to use an alternative filter in the case of an error occurring on the last download (check Use alternative filter).

You have yet another download option: your translated file, in plain text format, without any formatting. To do this, click File, then Bilingual File Tools and then Download Unformatted Text File:
If your translation is incomplete or contains provisional segments or notes, you will receive this warning:

At this point you have the choice to accept (OK) or cancel (Cancel) to return to your translation. If you accept, you will need to respond to the following message:

This is just to warn you that you are going to download your translated file without formatting.

**Find / replace**

It is often necessary to locate a word or text string in a file that has been translated. For this we use the **Document Search and Replace** function, the penultimate icon of the Wordfast toolbar:
As with other functions that require the segment to be closed, you should receive a warning that the current segment will be closed without being saved. If you agree, click OK, otherwise click Cancel to cancel the transaction and allow you to save your work.

Next the Search / Replace dialog will be displayed:

![Fig. 42 – Search / Replace (basic)](image)

Enter the word or text string you wish to locate in the Search field. Define whether the search should be performed on the source segments (Source) or target segments (Target) and click Search to search or Close to cancel the operation.

![Fig. 43 – Search / Replace (result)](image)

In this example, the word *plant* was found in two locations, in line 2 and line 6. You can repeat your search by entering more words and clicking Search. When you have finished, click Close.

You can expand the functionality of this feature by clicking on More:
You now have the possibility of replacing the found word or text string by another term. To do this, enter it in the Replace field. Attention, replacements can only be performed on target segments. You can also require that WFA respect the case of the search term (Case sensitive), that it mark as provisional any segment in which the term has been found (Mark found target as provisional) or that it add a note (Create a note for Every replacement). You can also specify that WFA update the TM segments corresponding to each replacement (Update TM for every replacement).

Here, the search for plant has returned two results: segments 2 and 6. By clicking on Replace you can have the word factory replace them. Optionally these segments will be marked as provisional or a can have a note associated with them, and the TM can be updated. You can also choose to do nothing by clicking Close.
**Analysing a text**

Before providing a translation quotation, it is recommended to analyse the text to determine what degree of difficulty is likely to be encountered. WFA provides an analytical tool for this purpose. To do this, click **File**, then **Bilingual File Tools** and then **Analysis Report**:

Depending on the size of your document, the analysis may take several seconds or even minutes. A progress message is displayed on the status bar. Then the analysis results will be displayed:

According to the number of repetitions (segments that are repeated in the document) or the percentage of segments corresponding to matches in the TM, you will be able to determine the volume of work actually requiring to be translated. After having examined the analysis report, click **Close**.

**Statistics**

You can find out where you are with your translation at any time. To do this, click **File**, then **Bilingual File Tools** and then **Statistics**:
A statistical report on your translation will be displayed:

![Statistical report]

**Fig. 49 – Statistics**

You will see the number of source and target segments, as well as the percentage already translated and the number of source and target words; the number of source and target tags and if there is any segmental discrepancy in terms of differences between the number and content of the source and target tags (segments with tag difference); the number of segments not stored in the TM (segments not saved in TM); the number of provisional segments (provisional segments) and notes (segments with notes). After viewing the statistics, click Close.

Another important indicator is always present on the status bar: it tells you on which segment you currently are in relation to the total number of segments in the document. In this example, the document has 6 segments in total and you are on number 5:
Updating the TM
Although the TM is automatically updated with each translated segment, you can force the update. To do this, click File, then Bilingual File Tools and then Update TM:

The following message will be displayed:

WFA shows the number of segments that will be updated in the TM. Click the Update TM button to confirm the update or Close to cancel.

Concordance search
Segments stored in the memory are retrieved only if they have a minimum level of correspondence with the source segment (typically 75%). However, they may contain terms that you have previously translated but do not remember. To search in the memory you have two options:

1) Click on the icon (Ctrl+Alt+C). The following window appears:
Enter the word or text string you want to research in the **Search** field. WFA will search for all words that are the same or begin with the same sequence of letters as the string entered. After you click OK, you will receive the result, for example:

![Search result](image)

All the TUs where the word *plant* appears are displayed, and this word will be highlighted, allowing you to see how you have translated it.

You can also select the word or text string with the mouse and then click on ![icon] or use the **Ctrl+Alt+C** shortcut. The result will be displayed immediately.

You can add to your search possibilities by choosing the **Advanced** option:
- Two words separated by a space: one or the other must exist in the TU
- Two terms separated by the + sign: both terms must exist
- A term starting with an asterisk: a search is performed for all text strings containing the search term.
When you use this option, a help line is displayed to remind you how this command works:

```
cat dog = cat OR dog | cat+dog = cat AND dog | *cat = bobcat OR cat | cat = cat OR cats OR catfish
```

**Searching in a glossary**

If the concordance search did not produce the results you were looking for, you can perform one on the glossary. To do this, click the icon or use the Tools/Glossary Search menu option or the Ctrl+Alt+G shortcut:

![Fig. 53 – Searching in the glossary](image)

Type the source language word you wish to search for in the **Search** field and click OK. The list of terms that contain the search word will be displayed.

You can edit or delete a term in the search window. Just click on the **edit** or **delete** links.
Other tools

Alignment

When you begin to translate with a CAT tool you cannot derive the maximum benefit from it because you do not yet have a translation memory. You can quickly derive a TM by performing an "alignment" on the documents you have already translated prior to using WFA for your translation work. WFA has an alignment tool that allows you to create your TM. Attention: the maximum size of a file to be aligned is 5,000 segments.

To do this, click Tools, then Align your files:

![Alignment Menu](image)

A new page will open, displaying the following dialog:

![Dialog](image)

You must first select the language of the original document. WFA is optimised for German, English, Spanish, French, Italian, Dutch and Portuguese, so the codes of these languages are already in the little drop-down menu at the top left. If the language of your choice is not one of those proposed by the drop-down menu, select other. Another dialog will open:
Enter the language code of your document. The regional variant is not necessary. Unfortunately, some languages like Greek, Chinese and Japanese cannot be recognised. Next click on **Choose** to continue or **Close** to cancel.

You must now designate the original document to be aligned. Click **Upload**:

Click **Browse...** to locate the document to upload on your computer. Acceptable document formats are .doc, .docx, .rtf, .xls, .ppt, .inx and .mif. Your document can optionally be compressed in .zip format. The maximum size supported by WFA is 5000 segments. When you find your file, click **Submit** to upload it to WFA or **Cancel** to terminate the operation. This upload may take some time, you will see the **Uploading, please wait**, message, please be patient.

You must repeat the operation for the translated document. Once the two documents have uploaded, you must choose the format of the TM; either TMX (which can be used on most CAT tools) or TXT (the native format of Wordfast Classic). WFA can use either format. You must also enter your email address, to which the WFA TM produced should be sent. Then click **Align**. Do not expect a response on the site, the TM will be sent by email.

**WFA Setup**

The WFA Setup menu, which has been partially seen in the creation of TM and glossary, is used to configure all the options and resources. It is accessible by the shortcut Ctrl+Alt+W or the icon or the Tools / Open Setup Dialog Box menu item.
Five tabs are visible: **General, TM rules, Shortcuts, Segmentation** and **Profile**.

### General tab

1. **Use my TMs and glossaries.** This facilitates the configuration of your TM and glossary.  
   a. To check if your glossary and TM are properly configured, click **Test**. A line showing you their size and, if relevant, an error message, will be displayed at the bottom of the window.  
   b. To set up your TM and glossary, click **Setup**. Another window opens, allowing you to configure your TM (TMs) and your glossary (Glossaries).

#### Configuring the TM
TMs tab — On the selection area to the left you will see a list of TMs that exist in WFA. If the TM you require appears in the list, select it. You also have the option to:

i. Create a new TM: New TM button.

General tab. If you enter the first letter of the target language in the Source language field, a list of all languages and versions that begin with that letter will be displayed. Select the source language of your choice. Then repeat for the target language in the Target language field. If a TM for this language pair already exists, enter a name in the Symbolic name field in order to be able to distinguish it. Finish by clicking OK or cancel the operation by clicking the Cancel button.
Attributes tab. You have the possibility to define attributes of your TM, which will allow you to subsequently identify its segments. There are five attributes in a Wordfast TM: the first is fixed and immutable, consisting of the name of the user. The other four can be defined by each user at will, but it is recommended to use attribute 1 to describe the subject of the text to be translated and attribute 2 for the client, to maintain compatibility with Wordfast Classic and Wordfast Pro users. Attributes consist of codes, usually 3 letters, followed by a brief description. In the fields referred to as TM attribute 1 to 4, enter the name of the attribute (subject, client, etc.). In the field on their right, select one of the attributes that appear on the drop-down list or, if necessary, click add to add an attribute, upd to update it or del to delete it. Whatever option is chosen, a dialog will appear asking for the code of the attribute (ID) and a brief description (Name, ignored for the Del option). Finish by clicking OK or cancel the operation by clicking the Cancel button.

ii. View the details of your TM: Details button.
The details displayed allow you to share your TM with Wordfast Classic (VLTM tab) or Wordfast Pro users. In the Server Url field you will see the address of the TM you will need to provide these users with. There is also information concerning the source and target languages (Source language and Target language) and the name of the work group that has been assigned to you (Workgroup ID). These three pieces of information, the URL, the languages and the ID of your TM, must be provided to Wordfast Classic or Pro in order for them to be able to access the memory. The name given to a memory with WFA (its Symbolic name), which serves to partition a pair of languages, cannot be taken into account when sharing with Classic or Pro: all of the language pair will be shared and the WFA memory names will appear in the first attribute of a TU. Finally, by clicking on Test you can check if your TM is available. Finish by clicking OK or cancel the operation by clicking the Cancel button.

iii. Deleting the TM selected on the left: the Remove button.
The only two possibilities are to confirm (OK button) or cancel (Cancel button). You can check if the language pair (Source language and Target language fields) and, if necessary, the (Symbolic name), are those of the TM to be deleted.

iv. Uploading a TM from your computer: the **Upload button**.

The codes for source and target languages are already set in the header of the TM, so there is no need to specify them. However, if you already have a TM in the same pair, ensure that you enter an identifier of up to 10 characters in the **Symbolic Name** field. It is recommended to compress the TM to be uploaded into a .zip archive. The TM itself may in Wordfast TXT format or TMX. The TM to be uploaded may not exceed 500,000 TUs. For large files, importing the
TM to the server happens automatically in the background and can continue even if you exit the application. Finally, click OK to continue, or on the Cancel button to cancel.

You will then need to browse your hard drive to select the file to download. Finally, click Submit to upload, or on the Cancel button to cancel.

v. Merging the existing TM with another one to be uploaded: the Merge button.

![Fig. 62 – Merging a TM](image)

To merge two TMs, you must first choose an existing TM from the list. The codes for source and target languages and, where applicable, the symbolic name of the existing TM you selected, will appear in grey. However you can have WFA take into account the variations corresponding to those of the existing TM by ticking the Check variant box. By selecting the relevant option from the Update TM drop-down list you may choose to add new TUs to the existing ones (Keep Existing TUs) or replace them (Overwrite existing TUs). It is recommended to compress the TM to be uploaded into a .zip archive. The TMs may be in Wordfast TXT or TMX format. The TM to be uploaded may not
exceed 500,000 TUs. Finally, click **OK** to continue, or on the **Cancel** button to cancel.
You will then need to browse your hard drive to select the file to download. Finally, click **Submit** to upload, or on the **Cancel** button to cancel.

![Image](image1.png)

---

vi. **Downloading the TM selected on the left:** the **Download** button.

![Image](image2.png)

**Fig. 63 – Downloading a TM**

Before continuing, check whether the original and target languages (**Source Language** and **Target language**) and, where applicable, the symbolic name (**Symbolic name**) are those of the TM to download. You can also click on **Test** to determine whether the TM is available and find out how many TUs are available to download. From the **Downloaded file format** drop-down list you can select either the Wordfast standard TXT format (**Wordfast TM format**) or TMX (**Standard TMX format**). Finally, click **OK** to continue, or on the **Cancel** button to cancel. Depending on your browser setup it will either save it or ask you to specify the location on your hard drive to which you want to download the TM.

**Configuration of the glossary**

**Glossaries tab** – In the selection area to the left you will see a list of existing WFA glossaries. If the glossary you require appears in the list, select it. Warning: the language pair of the glossary should correspond with the relevant TM. You also have the option to:

i. Create a new glossary: **New** button.
If you enter the first letter of the source language in the **Source language field**, a list of all languages and versions that begin with that letter will be displayed. Select the source language of your choice. Then repeat for the target language in the **Target language** field. If a glossary for this language pair already exists, enter a name in the **Symbolic name** field in order to be able to distinguish it. Finish by clicking **OK** or cancel the operation by clicking the **Cancel** button.

ii. Disconnecting the glossary
   If you do not want to use the glossary for the duration of this session, click **Turn off**. The **No glossary** message will be displayed at the bottom of the window.

iii. View the details of your glossary: **Details** button.

   ![Glossary Details](image.png)

   You will see the source and target language codes displayed, as well as the glossary's identifier. By clicking on the **Test** link, the glossary will be verified and you will see how many words it contains.

iv. Deleting the glossary selected on the left: the **Remove** button.
The only two possibilities are to confirm (OK button) or cancel (Cancel button). You can check if the language pair (Source language and Target language fields) and, if necessary, the (Symbolic name) identifier are those of the TM to be deleted by clicking on the Test link.

v. Uploading a glossary from your computer: the Upload button.

Unlike a TM, the source and target language codes are not written in a glossary's header, so you have to specify them. However, if you already have a glossary in the same pair, ensure that you enter an identifier of up to 10 characters in the Symbolic Name field. It is recommended to compress the glossary to be uploaded into a Zip archive. Glossaries can be in Wordfast TXT format or plain text format (each line containing the original term followed by the translated term, separated by a tab). Finally, click OK to continue, or on the Cancel button to cancel.

You will then need to browse your hard drive to select the file to upload. Finally, click Submit to upload, or on the Cancel button to cancel.
vi. Merging the existing glossary with another one to be uploaded: the **Merge** button.

---

**Fig. 67 – Merging glossaries**

To merge one glossary with another, you must first choose an existing glossary from the list. The codes for source and target languages and, where applicable, the symbolic name of the glossary to be uploaded, will be those of the existing glossary. Make sure that the glossary to upload corresponds to the existing one because there is no control possible over languages for glossaries and it is possible to inadvertently mix them. It is recommended to compress the glossary to be uploaded into a Zip archive. Glossaries can be in Wordfast TXT format or plain text format (each line containing the original term followed by the translated term, separated by a tab). Finally, click **OK** to continue, or on the **Cancel** button to cancel.

You will then need to browse your hard drive to select the file to upload. Finally, click **Submit** to upload, or on the **Cancel** button to cancel.

vii. Downloading the glossary selected on the left: the **Download** button.
Before continuing, check whether the original and target languages (Source Language and Target language) and, where applicable, the symbolic name (Symbolic name) are those of the glossary to download. You can also click on Test to determine whether the glossary is available and find out how many terms are available to download. Finally, click OK to continue, or on the Cancel button to cancel. Your browser will ask you to indicate where you want to download the glossary to on your hard drive.

Sharing your TM and glossary

You can allow other users to share your TM as well as your glossary: to do this, click on the Share/Revoke button. At that time you will receive the following:

If you have already enabled the sharing of your TM and your glossary with other users, they will be displayed in the Your existing shares field. You can revoke sharing with any of these users. To do this, select the user in question and click
**Revoke.** Repeat for each user whose sharing permission you want to revoke. To enabling sharing for another user, first define privileges in the block labelled *To invite a guest, set first your guest privileges.*

For the TM: if you do not want your guest to delete your TUs from a segment having an identical source, choose *Add TUs, keep your TUs*; this choice has the disadvantage of creating duplicates for the same source segment. By contrast, to avoid duplications, and if you trust your guest, choose *Add TUs, Overwrite your TUs [O]*.

For the glossary: if you allow your guest to add his terms to yours, choose *Add terms*, otherwise choose *Do not add terms (read only) [R]* to keep the glossary in read only mode.

Then type the email address with which he has registered on WFA in the *Type your guest's email (WFA login) and click "Share"* field and click *Share*. Finish the operation by clicking *Close*.

### Using a shared TM and glossary

Instead of using your own TM, you can use one that another user is sharing with you, with or without a glossary. To do this, check *Use a shared TM and glossary*. Then click on *Join*. 

---

*Fig. 69 – Using a shared TM and glossary*
A list of colleagues, who are sharing their TM with you, as well as possibly their glossary, is displayed. Select the email address of the colleague of your choice and click **Join**. The information in the TM (and glossary) will be displayed at the top of the window, together with the owner's email address. By clicking on the **Test** link the TM and glossary will be verified and the number of TUs and glossary terms will be displayed.

If you own your own TM server (Wordfast Server), or if you requested the use of a specific TM server, you can configure this TM specific server. To do this, check **Use a specific TM server**. The owner of the server will provide the instructions for completing this dialog.

**VLTM**

WFA has access to the public TM server, which consists of segments offered by the community of translators and is available to all under the name VLTM (Very Large Translation Memory). The TM is unrestricted, free of charge and anonymous. To help you translate your segment you can receive suggestions from your TM, machine translation (MT, see below) and the VLTM. To enable the VLTM, check the **Use VLTM** and click **Details** for other options.

![ VLTM](image)

To specify a penalty (see below, under the **TM rules** tab), check VLTM penalty. The penalty chosen, from 1 to 5, is specified from the drop-down menu on the right. **Export private TUs** is a temporary option, reserved for recovery procedures.
Machine translation

WFA gives you the ability to translate each segment by online translation services like Google Translate and Microsoft Translator. The translations proposed are not ever likely to be fully acceptable. However, by making a few small adjustments, you will be able to use them extensively in your translations.

Caution: when using this service, the source segments that will return a translation are transmitted to Google and Microsoft. It is up to you whether or not to accept these translations; these companies are not made aware of your choice. However, be aware that sending the segments to Google and Microsoft may raise privacy issues between you and your customers.

To activate this service, select **Use MT when no match**. The suggestions are only made if no match is found in your TM or, if you use it, the VLTM. By clicking on the **Details** link you will be able to check the tags **Remove tags before sending to MT**. Tags are internal formatting codes that can interfere with machine translation.

Other configuration settings

![Fig. 71 – Other configuration settings](image)

**Font Size**: this setting only affects the font size on the screen, your document will keep all its original layout unchanged. The available sizes are selected from the drop-down list.
Font Family: this setting only affects the fonts displayed on the screen, your document will keep its entire original layout unchanged. You can specify a specific font or a font family, for example Arial, Helvetica, Sans Serif (sans serif font, default) or Times New Roman, Times, Serif (serifed font).

Target segment selection: positions the mouse pointer at the opening of the segment, with or without selection.
1. Cursor at start – no text selected, cursor positioned at the beginning of the segment.
2. Cursor at end – no text selected, cursor positioned at the end of the segment. This is the default setting.
3. Segment selected – The target segment is entirely selected.

Fuzzy Threshold in %: percentage of similarity required for a TU contained in the TM to be suggested as a translation of the source segment. If several TUs meet this criterion, the TU with the highest percentage will be offered. In this case you can select the subsequent TUs with the (Alt + Right) and (Alt + Left) icons. The default percentage (75%) is recommended for most translations, but in some cases it may be appropriate to change it. For example, if you are translating short segments containing only 3 words, a fuzzy threshold of 75% will only offer those TUs which are identical (100%) and those where two words are identical, i.e. 66%, will never be proposed.

Copy source when no match: if no TU is proposed by the TM and if machine translation is not enabled, WFA will open an empty segment for you to type the translation in. However, by modifying this setting (yes instead of no) WFA will copy the source segment.

Display segment toolbar: Displays a toolbar specific to the editing of an open segment. By default this toolbar is displayed (yes) but you can hide it by choosing no.

Plain text mode for mobile device: To use WFA on mobile devices that do not have all the editing capabilities of a computer browser, it is necessary to use a cut down editing mode containing only text. In this mode, the tags lose their colour and are just text with no way of knowing what they represent.

Real time collaboration: If you share the same memory as another user and wish to receive proposals from this memory in real time (that has just been validated by other colleagues), activate this option, which negates the need for pre-emptive research and the use of a data buffer. In this case, the search for the next segment is made when you commit the current segment. This option has the disadvantage of delaying the opening of the segment as it waits for all searches to be completed. It is not advisable to use the VLTM in this case.

TM rules tab
Here you have the opportunity to establish penalties to be taken into account when calculating the similarity between the TM and the segment to be translated. In other words, the percentage of similarity is reduced, where applicable, according to the figure indicated for each of the following rules. Some rules allow fractional reductions, but this only applies to the calculation: the final reduction will be the sum of all penalties rounded to the nearest whole number. If the percentage of similarity to the TU, reduced to the sum of the penalties, is less than the specified Fuzzy Threshold percentage, it will not be proposed.

Penalties for the following rules are activated only if the box on their right is checked. They apply only to the TUs proposed by the TM or VLTM, not from machine translation, which has its own non-modifiable penalty.

**Case penalty**: if there is a difference in case (upper and lower case) between the TU and the segment to be translated, WFA can ignore this and show 100% similarity. But you can assign a penalty of between 1 and 5 points for the difference in case. This rule is selected by default with a penalty of 1.

**Non literal penalty**: this penalty detects differences due to special characters such as dashes, quotation marks, apostrophes, punctuation and whitespace characters (non-breaking space, horizontal and vertical tabs, ...). There exist several codes for representing each of these special characters. WFA can ignore these and show 100% similarity; otherwise a penalty is calculated using the following method: every time a difference is encountered, it adds the value of the first parameter (0.25, 0.50 or 0.75), which by default is 0.50. The second parameter sets out what the minimum value of the penalty is (default is 1). Since the penalty is necessarily an integer, if the value of the penalty is 0.25 and there is only one in the segment to be translated, the minimum is not reached. Finally, the third parameter sets the maximum penalty to be assigned, even if the addition of all the differences of this rule exceeds that figure (10 by default). This rule is selected by default with a minimum of 1 and a maximum of 10.
Tag penalty: this rule works exactly the same way as the previous one, but applied to the tags (markers that represent the bits of code used to format the document). This rule is selected by default with a minimum of 1 and a maximum of 10.

Alignment user penalty: the TUs found in a memory imported into WFA produced by an alignment tool and having the identifier "TALIGN!" may be assigned a penalty from 1 to 10. This rule is selected by default with a penalty of 3. Please note, TUs from an alignment may not have the "TALIGN!" identifier.

MT user penalty: the TUs found in a memory imported into WFA produced by machine translation and having the identifier "MT!" may be penalised from 1 to 10. This rule is selected by default with a penalty of 25. Please note, TUs from a machine translation may not have the "MT!" identifier.

Multiple translation penalty: In the case of a source segment with multiple 100% matches, i.e. several TUs having the same source segment but different translated segments, a penalty may be applied to warn of a possible choice between translations. This scenario is rare and no penalty is assigned by default.

Attribute penalty: attributes are identifiers that are associated with a particular TU at the time that it is recorded in the memory. There are five possible attributes: the first is fixed (it identifies the user who posted the TU), while the other four can be user defined. In general, translators use attribute no. 1 to define the subject of the text to be translated and the attribute no. 2 to define the client who owns the text. The other two attributes are free to be used for anything else. For example, if the proposed TU is from a text whose subject is "electronics", it will be penalised if the subject of the text to be translated is "medicine." In other words if the TU is 100% identical to the segment to be translated, it will be displayed with a percentage similarity of 98% if the penalty applied is 2 points.

The penalty can be a number from 1 to 5, valid for the four attributes. By default this rule is not active.

If you use a TM uploaded from Wordfast Classic or Pro, the existing attributes of the TU may be penalised.

Shortcuts tab
WFA shortcuts are not immutable. If some of them do not suit you, you can reassign them. To do this, click on the upd link of the shortcut you wish to change.

In this example, corresponding to the first shortcut, you see the name of the command and a drop-down list. Choose None if you want to remove the shortcut or choose another from the list. Then click Update to confirm or Cancel to dismiss the dialog. Repeat for all the shortcuts that you want to change. The new keyboard shortcuts will be displayed.

The last four commands have no shortcuts; however, you can assign shortcuts to them if you wish.

If after modifying several shortcuts you want to return them to their original state, click Restore default shortcuts.

Finally, click Save settings to confirm any changes or Cancel to dismiss the dialog.

**Segmentation tab**
This tab defines the rules for segmentation.
**Segmentation style** — this block determines how the segmentation will be performed. If you choose **Wordfast /Trados segmentation** (default) the standard end-of-segment markers are defined as follows: full stop, colon, question mark, exclamation mark and tab (Tab). You can add other characters as well as space (Space), non-breaking space (NBSP), carriage return (CR) and line feed (LF). You can add as markers: a number followed by an end of segment marker (A number Followed by ESM year ends a segment — default), an end of segment marker not followed by a space (An ESM without a trailing space ends a segment) and an end of segment marker followed by a space followed by a lowercase letter (An ESM followed by a space followed by a lower-case letter ends a segment). Although you can change these markers, it is recommended to maintain them in such manner that if you share your translations and your memories with other translators, all will follow the same rule.

Attention: segmentation is performed at the time of uploading the document to WFA. You cannot therefore change the rules applying to that document during the course of its translation.

The other segmentation rules that you can choose are:

**Break segmentation** - segmentation is done according to the end of paragraph character (carriage return) or the `<br>` tag for HTML files.

**Idiom segmentation** — segmentation follows the rules of the software program Idiom.

**SRX segmentation** — the segmentation is done by using a previously uploaded file. It follows the rules of the SRX standard, which has become a standard like TMX for formatting.
memories and TBX for formatting glossaries. In the case of SRX segmentation, abbreviations are also included.

**TM compatibility** – You must ensure the compatibility according to the memory you have uploaded or the subsequent use of your documents. By default, WFA's memory is compatible with that of Wordfast Classic and Pro (**Assume Wordfast TM**). If this is your choice, you can also specify if you have old projects made with Wordfast Classic or Pro (check **Legacy TM created by old projects**). You can also establish that the memory was created by Trados (**Assume Trados TM**), even adding that it was created by Trados and Word (**TM created by Trados + Word**); by Idiom (**Assume Idiom TM**) or by SDLX (**Assume SDLX TM**).

**Abbreviations** – Abbreviations end with a full stop, which WFA then interprets as an end of segment marker. To avoid this, WFA allows you to create and manage a list of abbreviations. While WFA already has lists for some languages, others are empty – the user must provide the necessary information. The abbreviations are entered into the text box, one after another, without spaces and separated by a comma. Once updated, save your list by clicking on **Save the language**. Repeat for each language that you translate.

Finally, click **Save settings** to confirm any changes or **Cancel** to dismiss the dialog.

**Profile tab**

![Fig. 75 – User Profile](image)

This tab displays a summary of your workspace. You will see your identification (**Login**), your password (**Password**) that you can change by clicking the **Change password** link, your workgroup (**Workgroup ID - identifies your TM**) and your username (**User ID – this identifies the TUs you produce**) and the documents, TM, glossaries and shares you have at your disposal in your workspace.

You can also remove your account by clicking on the **Delete your account** link.
